Genome polyprotein [Contains: Capsid protein C (Core protein (P22);
Envelope glycoprotein E1 (GP22) (GP55); Envelope glycoprotein E2 (GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P57); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J8) (HCV).
                                                                                                                                                CELLULAR AMINOPEDITIDASE.
CELLULAR AMINOPEDITIDASE.

Full-length Sequence of a hepatitis C virus genome having poor
genotypes...
                                                                                                                                          Virology 188131-341(1992).

-!- FUNCTION: THE SMALL PROFEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the Postion, Cys or Thr in P1 and Ser or Ala in P1'.
                                                                                                                                                                                                                                                                                                                                     SUBDIVIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CABSID PROTEIN C (POTENTIAL).

"Molecular cloning of hepatitis C virus genome from a single Japanese carrier: sequence variation within the same individual and among infected individuals."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        VILLUS RES. 23:39-53 (1992).

-1 FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4B AND NS4B ARE HYDROPHOBLE. SUGGESTING A POSSIBLE MEMBRANE-RELFED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1 CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or 31u in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-1 CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -1- SUBDIVIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

I. SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS.
PROTEIN A AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MINA (BY SIMILARITY).

Submitted (Nov-1999) to the EMBL/GenBank/DDBJ databases.
-!- SUBMIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN B. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

"Comparative Sequence Analysis of the Core Protein and Its Frameshift Product, the Frotein, of Hepatitis C Virus Subtype 1D Strains Product, the Frotein, of Hepatitis C Virus Subtype 1D Strains obtained from Patients with and without Hepatocellular Carcinoma."; Submitted (JAN-2002) to the EMBL/GenBank/DDBJ databases.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Genome polyprotein (Fragment).
Hepatitis C virus type 1b.
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
Submitted (MAY-2001) to the EMBL/GenBank/DDBJ databases.

-- SUBMIT: THE VIEND OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

artificial gene and the resulting mosaic protein improve the sensitive spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAYO6673-683 represent amino acid sequence of each monomer comprising the NC mosaic protein.

                                                                                                                                                                                                                                                                                                                                                                                            ö
                                            The invention relates to a mosaic protein, comprising a plurality of annologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a mosaic protein, comprising a plurality of monologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted provided. The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mosaic protein; antigenic peptide; nucleocapsid; NC; hepatitis; REAL; restriction endonuclease assisted ligation; vaccination.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosalc protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosalc protein and the artificial mosalc protein are useful for detecting a hepatitis infection in an individual. The mosalc gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, and antigen specificity of enzyme immunosacitylity, and antigen specificity of enzyme sequences AXY06673-683 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymerase chain reaction; PCR; amplify; primer; non-A, non-B hepatitis; NANBH; virus; blood transmissible; detection; hepatitis virus; RT-PCR; C100 antibody; HCV RNA; NS5 region.

                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is encoded by the genome of a blood transmissible non-A, non-B hepatitis (NANBH) virus. The CDNA sequence was isolated using the primers given in AAQ63500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were C100 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on CDNA and the total human NANBH DNA was constructed from 23 clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to nucleic acid construct which comprises an expression cassette including a first polynucleotide region including a 5 non-coding region (NCR) sequence of an RNA virus and at least an N-terminal portion of a coding sequence of RNA virus, a second polynucleotide region including a 3 untranslated region (UTR) sequence of the RNA virus and at least a C-terminal portion of a coding sequence of the virus and a thirst polynucleotide region encoding a reporter molecule, flanked by first and second polynucleotide regions; and a promoter sequence being operatively linked to expression cassette in a manner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. Nucleic acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is also useful for screening anti-viral drugs and determining drug
Novel nucleic acid construct useful for detecting the presence of RNA virus, comprises an expression cassette and a promoter operably linked to expression cassette for minus strand RNA transcription of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is encoded by the oligonucleotide, CN14, and represents the peptide fragment CP14. CP14 is a fragment of the core region of hepatitis C virus (HCV). CP14 may be used in the detection of HCV infection and to raise antibodies against it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                resistance of an RNA virus. The present sequence is Hepatitis \check{\mathbf{C}} virus (HCV) isolate HCV-S1 full-length polyprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection of hepatitis C virus - using oligopeptide fragment of HCV

The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific antibodies.
                                                                                                                                         Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-B hepatitis; competitive; inhibition assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-A, non-B hepatitis; competitive; inhibition assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic peptide epitope with sequence encoded by hepatitis-C virus - for immunoassay for antigens for diagnosis of non-A, non-B hepatitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific

The present sequence represents a Hepatitis C virus (HCV) protein sequence from the disclosure of the present specification. The present specification describes a chimeric HCV peptide antigen which comprises at least 2 peptide epitope regions from the HCV polypeptide core region, 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS4 region. The antigen binds specifically with an antibody produced by a human infected by HCV. The peptide can detect a wide range of HCV infections with high sensitivity.
                                                                                                                                                                                                Gaps

They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capaid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a peptide, which is recognised by antibodies against amino acids 2-45 at the N-terminus of the core (or nucleocapsid) possibly to the period of hepatitis C virus (HCV), or its variants. The peptide has a tertiary structure consisting of two alpha-helical fragments, almost compendicular to each other in space, connected by a junction peptide. Excluded are all proteins and peptides comprising, or consisting of, the N-terminal part of p21 starting from amino acid to x 2. Also new are cc (1) monoclonal or polyclonal antibodies produced using the peptide as an immunogen and (2) complex consisting of the peptide specifically cound to some other molecule, particularly peptide or nucleotide concentrating antibodies and (ii) for detecting and capments or functionalised aromatic compounds. The peptide is used (i) as immunogen for generating antibodies and (ii) for detecting and capments formation). Antibodies are used correspondingly to detect HCV or related antigens. The peptide and antibodies may also be used to treat or prevent HCV infections. The present sequence represents the N-terminus contracts of the core p21 protein of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

diagnosing and preventing hepatitis C infections -

The present peptide, designated S42G, corresponds to residues 2 to 45 of the N-terminus of the human hepatitis C virus (HCV) core protein. It is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoreactivity with all the sera of individuals or blood samples infected with HCV and which possess substituted for homologous amino acros protein. An amino acid may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino sequence and its antiqenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against the virus. N.Contains: core protein
C.Species: hepatitis C virus
A.Variety: genotype 2, N6
C.Date: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C.Accasaion: S41357

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Genome polyprotein (Contains: Capaid protein C (Core protein); Matrix
protein (Envelope protein M); Major envelope protein E; Nonstructural
proteins NSI and NS2) (Fragment); Hepatitis C virus (isolate HG-75) (HCV).
Viruses; SERNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENOTYPES. ";
VITOLOGY 188:31-31(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MANA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  VITOLOGY 188:331-341(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY FLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN A AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           proteins NS1 and NS2] (Fragment).
Hepatitis C virus (isolate HC-J7) (HCV).
Viruses: ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEQUENCE FROM N.A.
